Question # 5:

(A)

(B)

Question # 6 :

## (a) 1. Players :

Max - Defender : AI-powered IOS will defend the network from external attacks.

Min - Attacker : It is meant to breach the network using various attacks.

## 2. Decision Making :

Max - Defender : Use strategies such as deploying firewalls, patching sys, or ignoring alerts to min. the damage caused while maintaining costs.

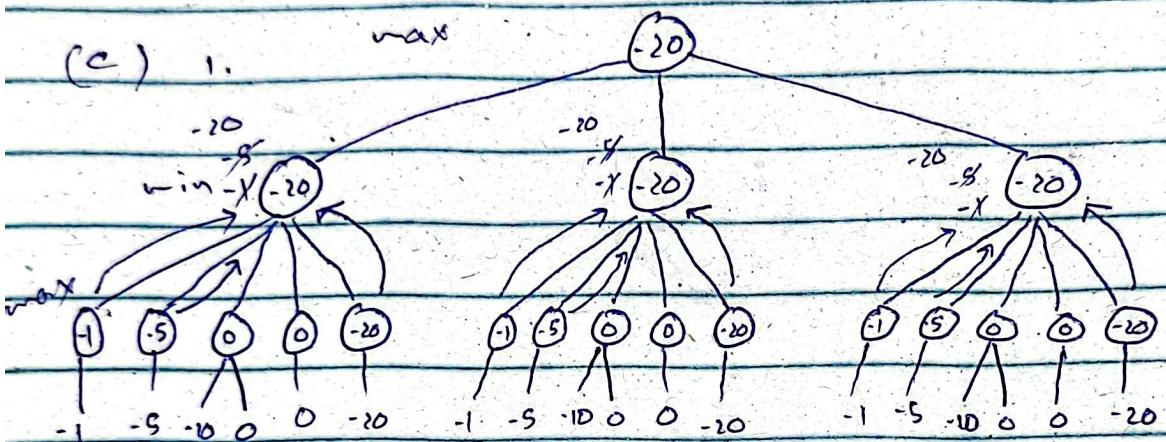

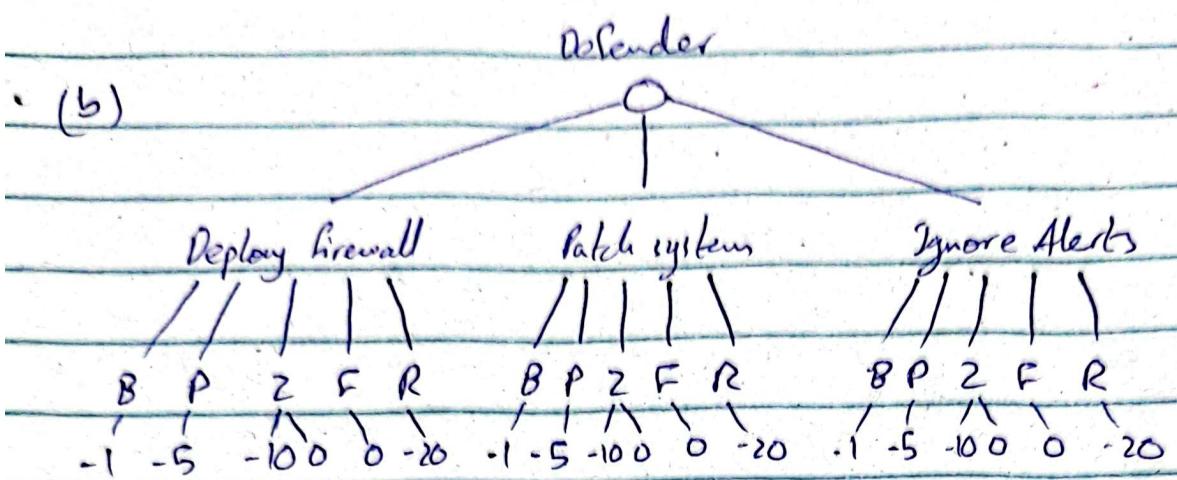

Min - Attacker : Use attacks like brute-force, phishing etc.

## 3. Stochastic Elements :

Attacks like zero-day exploit are probabilistic with 50% success rate. They introduce uncertainty and the defender may need to shift its focus from worst-case to avg-case based on probability.
